

IMDS AGENTIC WORKFLOW

Own the IMDS desk. Same-day accept. Zero PPAP delay.

50 MDS land in our inbox every working day. ~5,000 sit open — about 100 days of intake if nothing new arrived. Every one is a production-authorization document, not paperwork.

PRESENTED BY

Finance

TODAY'S DATE

Thursday
27 August 2026

TODAY'S ASK

Invest in Agentic AI Today. Approve the 20-MDS live pilot and the internal budget line (implementation, training, maintenance). Name Supplier Quality as accountable owner, with executive sponsorship and a governance halt.

Eight beats. This is how we run the room.

Use as a 60-second agenda, or skip and jump to Pain Points. Spoken hooks are on every notes page.

#	Beat	Slide intent	Spoken hook	Goal
1	Executive Opening	Title with project name, presenter, and date. Hook first.	Fifty MDS land every day. Five thousand sit open. IMDS is a production gate — not a filing cabinet.	Capture attention and establish urgency.
2	Pain Points	Visual of inefficiencies, missed same-day accept, rising launch cost.	Inaction is already on the P&L: specialist hours, PPAP delay, OEM scorecard exposure.	Make the audience feel the cost of inaction.
3	Proposed Solution	Diagram: ingest received MDS → orchestrate Check → PASS/FAIL output.	The live agent already runs our IMDS account: PASS accept-forward-propose; FAIL reject.	Position AI as a strategic enabler, not just a technical tool.
4	Business Impact	Before/after: manual inbox versus the agentic workflow.	Hours return to specialists. MDS stop stalling PPAP. Decisions are logged.	Show tangible transformation.

Beats 5–8: money, rollout, proof, the ask.

Close on “Invest in Agentic AI Today” plus a specific pilot / budget approval — not a vague endorsement.

#	Beat	Slide intent	Spoken hook	Goal
5	Budget & ROI	Implementation, training, maintenance. Payback window.	Internal effort, not a software RFP. Pilot hours pay back inside one quarter.	Demonstrate financial viability and risk mitigation.
6	Implementation Roadmap	Timeline: Pilot → Scale → Optimize, with governance.	Controlled rollout: 20 MDS, logged decisions, executive sponsorship, emergency halt.	Build confidence in execution.
7	Case Studies	External automotive / agentic-automation proof, labeled illustrative.	Peers already automated IMDS-class work. We keep OEM knowledge in-house.	Provide credibility and reduce perceived risk.
8	Call to Action	Bold line: Invest in Agentic AI Today. Specific ask.	Approve the 20-MDS pilot and the internal budget line this week.	Drive decision and secure buy-in.

The IMDS desk is a production gate run as a manual inbox

Frame this as ROI, launch risk, and competitiveness — not typing speed.

50

MDS received / day

Must be viewed before any accept or reject

~5,000

Open outstanding MDS

~100 working days of intake if inbound froze

8–60 min

Per MDS, by hand

Rec 001 + GM / VW / Ford overlays, node by node

PPAP wait

Cost of inaction

Unaccepted MDS = open production authorization

ROI

Specialist hours are spent on clicks — Check, accept, forward, propose, reject — not on supplier coaching or OEM-rule ownership. Hiring a parallel inbox does not encode three OEM rule packs.

Risk

Passing IMDS Check is not OEM acceptance. IMDS 15.2 says further review may be required. Wrongful accept is a Quality event. A bouncing MDS to GM, VW, or Ford restarts PPAP.

Competitiveness

We sit in two hops: Tier-2 to our customer and Tier-1 to the OEM. Dummy or unaccepted child MDS blocks the tree. Scorecards and launch dates do not wait for a 5,000-row backlog.

Capability

Judgment sits in a few specialists' heads. Leave or peak volume stalls launches. The scarce asset is the rule pack — not more people doing the same inbox.

Agentic workflow: ingest → orchestrate → output

A live inbox agent on our company IMDS account — not a nightly spreadsheet, not a vendor platform.

1 INGEST

Received MDS rows from our IMDS inbox. Default batch: 20. One-button Colab run. Secrets stay in Colab (key icon): IMDS_USERNAME, IMDS_PASSWORD, OTP_SECRET.

2 ORCHESTRATE

Open each row. Run IMDS Check. Network-resume if the session drops. Leftover own-MDS sheets are closed cleanly so IDs never mismatch the next row.

3 OUTPUT

PASS → accept + forward + propose to recipients 9994 and 293798. FAIL → reject. Preferred contact Qu, Theresa; any real Supplier Data contact if she is missing.

PASS

Accept the received MDS. Forward. Propose to company IDs 9994 and 293798. Contact: Qu, Theresa, with fallback to any real name in the dropdown.

FAIL

Reject with the Check result on the record. Do not forward. Do not propose. The specialist is not stuck in a click loop on a known-bad tree.

The live agent is already hardened for a governed pilot

imds_agent_v2.py on our licensed IMDS users only. Reliability is the governance story.

1 One-button Colab

Run from Colab_Start_Here. Credentials in Colab Secrets (key icon). Default 20 MDS. Leftover debug values of 3 or 10 are ignored so an old cell cannot shrink the pilot.

2 PASS path

IMDS Check with 0 errors → accept, then forward, then propose. Recipients 9994 and 293798. Preferred contact Qu, Theresa.

3 FAIL path

Check failures are rejected. The inbox does not accumulate known-bad MDS while specialists hunt clicks.

4 Network resume

A dropped session waits and continues the 20-row loop instead of aborting the batch. Production gates cannot depend on a perfect network afternoon.

5 Same-MDS tabs

“Do you want to save your changes?” is Yes when switching Supplier Data / Recipient Data on the same forwarded MDS so Propose finishes on the new own-MDS ID.

6 Leaving leftovers

The same prompt is No when leaving a leftover own-MDS sheet to search the next received row — Yes would keep the leftover ID and mismatch every later row.

Manual inbox versus the agentic workflow

Transformation is hours, launch risk, and a decision log — not a software logo.

Work	Before — manual desk	After — agentic workflow
Inbox	50/day viewed by hand; ~5,000 aging	20-MDS governed batch; same-session decisions
Check	Specialist walks every node, every overlay	Agent runs IMDS Check; PASS/FAIL is explicit
PASS path	Accept, forward, propose as separate click chains	Accept + forward + propose to 9994 and 293798
FAIL path	Rejects wait; reasons vary by who is on shift	Reject on Check failure; reason on the record
Contact / recipients	Theresa / org IDs re-typed; easy to miss	Preferred contact with fallback; both recipients every PASS
Disruption	Network drop or leftover sheet aborts the afternoon	Resume after drop; leftover sheets closed with No
PPAP / scorecard	Open MDS = open launch authorization	Same-day greens; reds returned to the supplier the same day
Audit trail	Tribal knowledge in specialists' heads	Excel check_summary with Action Result per row

Internal program hours. Zero software license. Payback inside a quarter.

Planning model for this briefing — not booked Johnson Electric P&L. No vendor invoice.

\$0

Software licenses

Classic IMDS browser + Colab Secrets. No Plus, no Examiner, no integrator.

~60 h

Implementation

Govern the live agent: logging, sample audit, halt, recipient/contact policy.

~16 h

Training

Specialists: exception handling, audit sampling, emergency halt drill.

~4 h/mo

Maintenance

Rule drift, recipients, contact fallback, secret hygiene, weekly sample audit.

ROI lever	How we count it	Why it pays back
Hours on Check / accept / forward / propose	15 min median × 50 MDS/day ≈ 12.5 specialist-hours/day (desk model)	Even ~25% of inbound automated returns 3+ hours/day. 60 implementation hours recover in weeks.
IMDS non-compliance / OEM scorecards	GM, VW, Ford completeness and bounce rate on our MDS	A scorecard miss is commercial risk. Logged PASS/FAIL is the control Finance and Quality can see.
Delayed PPAP / launch hold	Unaccepted or bouncing MDS blocks production authorization	One delayed PPAP dwarfs the pilot cost. Same-day reject also shortens supplier rework.
Payback period	Target: inside 90 days of pilot start	Hours recovered + avoided launch delay. Revisit after the 20-MDS pilot with measured minutes/MDS.

Pilot → Scale → Optimize. Controlled rollout, named governance.

We do not flip auto-accept on the 5,000-row stock on day one.

PILOT

Days 1–30

20 MDS live batches on our company account. Log every PASS/FAIL. Sample-audit greens. Freeze recipient IDs 9994 / 293798 and the Theresa-plus-fallback contact rule. Emergency halt stays in Supplier Quality's hands. Success: the 20-row loop completes without leftover-ID mismatch.

SCALE

Days 31–60

Raise daily burn on NEW inbound. Auto-reject FAIL patterns with structured text. Shadow-score remaining greens beside the specialist. Operations uses PPAP clock as the success metric. Supply chain chases dummy children the agent cannot invent.

OPTIMIZE

Days 61–90+

Auto-accept greens with weekly audit. Start a measured burn-down of the 5,000. Encode GM / VW / Ford overlays as Examiner-equivalent packs on top of Check. Role shift: specialists own rule packs and exceptions — not inbox volume.

GOVERNANCE — non-negotiable

Accountable owner: Supplier Quality Director. Executive sponsorship from VP/GM so the pilot is not re-argued every week. Own-account only. Sample audit of PASS accepts. Emergency halt on auto-accept / auto-reject in one action. Human-mandatory list: novel chemistry, OEM derogation, dispute. Stakeholder alignment: Quality (audit), Operations (PPAP clock), Supply chain (dummy-child follow-up), HR (role redesign, not a headcount cut).

External proof the category works. Not Johnson Electric results.

Vendor-reported and industry-analog. We keep OEM knowledge in-house; we do not rent the desk.

ILLUSTRATIVE / EXTERNAL — do not quote these as Johnson Electric metrics

Automotive IMDS platforms

DXC IMDS Plus / Inbox Automation; iPoint; APA MDS Xpress

Paid Examiner profiles and auto-accept if no errors. Proves OEMs already accept machine-paced inbox work. We have none of it, and we are not opening an RFP in v1.

Predco — vendor-reported, 12 Tier-1s

Automotive supply-chain compliance automation

–89% rejects, –72% cycle time, ~18 days PPAP recovery, 1.8% reject rate. Evidence the problem is solvable. Not a purchase recommendation. Not our ROI.

Certivo — vendor-reported

Agentic / automated MDS preparation

First-pass reject 30–40% → <5%; cycle 4–6 weeks → ~4 hours; ~80% less prep labor. Productivity and customer-readiness analog. Not booked JE revenue lift.

What we take from them: score, cite, structured reject, outbound pre-flight. What we do not do: outsource GM / VW / Ford overlays or our 5,000-row desk to a vendor that does not know our tree conventions. Johnson Electric metrics stay the ones on the pain and impact slides (50/day, ~5,000 open, 20-MDS live agent). Customer-satisfaction and revenue-lift figures above are theirs, not ours.

Invest in Agentic AI Today.

Approve the 20-MDS live pilot and the internal budget line this week.

- 1 Pilot** Authorize live runs of 20 received MDS on our company IMDS account (Colab one-button, Secrets in ).
- 2 Budget** Allocate the internal line: ~60 h implementation, ~16 h training, ~4 h/month maintenance. \$0 licenses.
- 3 Owner** Supplier Quality Director (Wong) owns rule packs, emergency halt, 90-day milestones, and the 5,000 burn-down.
- 4 Sponsorship** VP/GM executive sponsorship and stakeholder alignment so the pilot is the house approach — not a weekly re-litigation of buy vs hire.

Live-agent facts and glossary — skip in the 20-minute slot

Validate OEM overlays against current GM / VW / Ford IMDS portals before production use.

Term	Meaning	Term	Meaning
Executive sponsorship	VP/GM publicly backs the pilot so buy-vs-hire is not reopened weekly.	Emergency halt	One action stops auto-accept / auto-reject if a pack or Check rule drifts.
Own-account only	Our IMDS users, our company inbox/outbox. No other company's data.	PASS	IMDS Check with 0 errors → accept + forward + propose to 9994, 293798.
FAIL	Check failure → reject. No forward, no propose.	Preferred contact	Qu, Theresa. Fallback: any real Supplier Data name (not blank).
Network resume	After a drop, wait and continue the 20-row loop instead of aborting.	Save-changes Yes	Same forwarded MDS, switching Supplier / Recipient tabs.
Save-changes No	Leaving a leftover own-MDS sheet to open the next received row.	Dummy child	Placeholder node instead of an accepted sub-supplier MDS.
Pre-flight	Run the OEM overlay on outbound MDS before Propose.	OEM-rule owner	Specialist owns GM/VW/Ford packs and exceptions, not inbox volume.
